Lomustine (CCNU)
(loe-mus-teen)
Description: Anticancer Agent
Other Names for this Medication: Gleostine®
Common Dosage Forms: Veterinary: None. Human: 5 mg, 10 mg, 40 mg, & 100 mg capsules.

This information sheet does not contain all available information for this medication. It is to help answer commonly asked questions and help you give the medication safely and effectively to your animal. If you have other questions or need more information about this medication, contact your veterinarian or pharmacist.

Key Information
- Lomustine is a chemotherapy (anticancer) drug. This drug can be hazardous to other animals and people that come in contact with it. On the day your animal gets the drug and then for a few days afterward, all bodily waste (urine, feces, litter), blood, or vomit should only be handled while wearing disposable gloves. Seal the waste and any items used to clean it (eg, paper towels, gloves) in a plastic bag and then place bag in another bag (double bag) before placing in with the regular trash.
- Liver and bone marrow toxicity are possible; contact your veterinarian immediately if patient develops an infection, runs a fever, bleeds, has yellowing of the whites of the eyes, gums, or skin (jaundice), has persistent vomiting, or becomes ill.
- Lomustine may cause severe lung damage.
- Pregnant women SHOULD NOT handle any waste or items used to clean the waste while your animal is on this drug.

How is this medication useful?
Lomustine is used to treat a variety of cancers in animals. The FDA (U.S. Food & Drug Administration) has approved this drug for use in humans but it is not officially approved for use in animals. The FDA allows veterinarians to prescribe products containing this drug in different species or for other conditions in certain situations. You and your veterinarian can discuss why this drug is the most appropriate choice.

What should I tell my veterinarian to see if this medication can be safely given?
Many things might affect how well this drug will work in your animal. Be sure to discuss the following with your veterinarian so together you can make the best treatment decisions.
- Tell your veterinarian and pharmacist what medications (including vitamins, supplements, or herbal therapies) you are giving your animal, as well as the amount and schedule of each.
- Tell your veterinarian about any conditions or diseases your animal may have now or has had in the past.

©2019 PharmaVet, Inc. ALL RIGHTS RESERVED. Plumb's® Veterinary Medication Guides have not been reviewed by FDA Center for Veterinary Medicine.
If your animal has been treated for the same disease or condition in the past, tell your veterinarian about the treatment and how well it did or didn’t work.

If your animal is pregnant or nursing, talk to your veterinarian about the risks of using this drug.

Tell your veterinarian and pharmacist about any medication side effects (including allergic reactions, lack of appetite, diarrhea, itching, hair loss) your animal has developed in the past.

How long until I will know if this medication is working, and how long will the effects of this medication last?

This medication takes several days until beneficial effects occur. Full effects of this medication may not be evident for several weeks. However, side effects (eg, upset stomach or sleepiness) may occur right away. Improvement of clinical signs will be gradual over the time that it takes the medication to reach its full efficacy. The effects of this medication are moderate in duration, meaning they may last for a few days, although the benefits may be prolonged if your animal has decreased kidney and/or liver function.

When should this medication not be used or be used very carefully?

No drug is 100% safe in all patients, but your veterinarian will discuss with you any specific concerns about using this drug in your animal.

This drug SHOULD NOT be used in patients:

- That have had a severe allergic reaction to lomustine.

This drug should be used WITH CAUTION in patients:

- With bone marrow suppression, anemia, or an existing infection.
- With liver or lung disease. Lomustine may cause severe liver and lung damage.
- Kidney problems.
- That are nursing, pregnant, or used for breeding.

If your animal has any of these conditions, talk to your veterinarian about the potential risks versus benefits.

What are the side effects of this medication?

A common side effect of this drug is bone marrow suppression. The effects on bone marrow usually occur about 1-3 weeks after a treatment. Your veterinarian will do blood tests to watch for this, but if you see bleeding, bruising, fever (indicating an infection), or if your animal becomes tired easily, contact your veterinarian immediately.

Gastrointestinal tract toxicity can also commonly occur. Vomiting, lack of an appetite, diarrhea, ulcers or sores in the mouth and GI tract may be seen. If these are severe or continue, contact your veterinarian immediately.

Severe liver damage has also occurred following lomustine use. Your veterinarian may provide you with liver protectant drugs to help prevent or lessen liver damage from lomustine. Signs of liver damage can include tiredness/lack of energy, vomiting, not eating, bleeding, or yellow discoloration of the whites of the eyes, gums, or skin. If you see any of these signs, contact your veterinarian immediately.

Coughing or trouble breathing may indicate damage to the lungs. If you see any of these signs, contact your veterinarian immediately.

Dogs: Loss of hair. Many dogs receiving chemotherapy will have minor hair coat changes (eg, shagginess, loss of luster), and breeds with continuously growing haircoats (eg, poodles, terriers, Afghan hounds, old English sheepdogs) are more likely to experience significant hair loss.

If my animal gets too much of this medication (an overdose), what should I do?

Overdoses of lomustine can be fatal and even a small overdose should be considered an emergency. If you witness or suspect an overdose, immediately contact your veterinarian or an animal poison control center for further advice. Animal poison control centers that are open 24 hours a day include: Pet Poison HELPLINE (855-764-7661) and ASPCA Animal Poison Control Center (888-426-4435); a consultation fee is charged for these services.

How should this medication be given?

For this medication to work, give it exactly as your veterinarian has prescribed. It’s a good idea to always check the prescription label to be sure you are giving the drug correctly.

- Always wear gloves when administering this medication to your animal.
- Give this drug with food.
- Compounded liquid forms of this medication must be measured carefully. Your veterinarian or pharmacist can help by providing special measuring spoons or syringes.
- If you have difficulty getting your animal to take the medicine, contact your veterinarian or pharmacist for tips to help dosing and reducing the stress of medication time.
- This medication can be given for various lengths of time. Be sure you understand how long your veterinarian wants you to continue...
giving this medication. Prescription refills may be necessary before the therapy will be complete. Before stopping this medication, talk to your veterinarian, as there may be important reasons to continue its use.

**What should I do if I miss giving a dose of this medication?**
This drug must be dosed carefully. Contact your veterinarian for further instructions if you miss a dose.

**How should I store this medication?**
- Store this medication in the original prescription bottle at room temperature, protected from light.
- Keep away from children and other animals.

**Can handling this medication be hazardous to me, my family, or other animals?**
- This drug can cause serious adverse effects in people or animals that are exposed to it, disposable gloves should be worn while handling this medication; avoid contact with bare skin, eyes, or mouth. Be careful not to accidentally rub your eyes. Wear gloves when disposing of cat litter or dog droppings or cleaning up urine spills or vomit. Do not reuse gloves. Seal the waste with all gloves and items used to clean it (e.g., paper towels) in a plastic bag, then place into an additional plastic bag (double bag) before putting in the regular trash.
- Do not let treated animals lick human skin. If skin exposure occurs, the area should be washed thoroughly with soap and water. Contact your physician if you have any concerns.
- **Pregnant women SHOULD NOT handle any waste or items used to clean the waste while your animal is on this drug.**

**How should I dispose of this medication if I don’t use it all?**
- Do not flush this medication down the toilet or wash it down the sink. If a community drug “take-back” program is available, use this option. If there is no take-back program, mix the drug with coffee grounds or cat litter (to make it undesirable to children and animals and unrecognizable to people who might go through your trash), place the mixture in a sealable plastic bag to keep it from leaking out, and throw the bag out with the regular trash.
- Do not save leftover medication for future use or give it to others to use.

**What other information is important for this medication?**
- Your veterinarian will need to perform follow up examinations and blood tests on your animal after it receives this medication. Do not miss these important follow-up visits.
- Your animal should not receive vaccines containing live (or modified live) viruses while receiving this medication.
- In the interest of safety to other animals and humans, do not take your dog to a dog park or allow your animal to urinate and defecate in public places until your veterinarian tells you that it is okay to do so.
- Your animal should not participate in animal competitions while on this drug. Exposure to other animals may put your animal at serious risk of infections during chemotherapy treatment. Talk with your veterinarian about when it is safe to return to these events.

**If you have any other questions about this medication, contact your veterinarian or pharmacist.**
